Arthur Belanger

Program to figure out the shipping charges for a package using a .csv file

#3-17-25

IPO for assignment #5

1. Input:

    - Open packages.csv file.

    - Handle file not found error using try-except.

2. Processing:

    - Freight Charges Based on the weight of the package.

    - Additional Fees Based on handling and tracking.

    - Total Shipping Charge and additional fees.

    - Store the charges for each package in a list.

3. Output:

    - Print results in a formatted table.

    - Columns: Weight(oz), Handling, Tracking, Freight, Extra Fees, Total Shipping.

    - Each row shows the charges for a package.

 Main Program
read packages from a CSV file named 'packages.csv'
for each package:
extract weight, handling, and tracking information
figure freight charge using the add_freight function
figure additional fees using the hndl_track_fee function
figure total shipping cost by adding freight charges and additional fees
storethe results in a list

print the results in a formatted table

add freight Function

if weight is less than 16:

return weight x 0.21

elif weight is less than 32:

reutrn weight x 0.33

elif weight is less than 64:

return weight x 0.43

else: return weight x 0.59

hndl_track_fee Function

if both handling and tracking are 'yes':

return 7.50

elif either handling or tracking is 'yes':

return 5.00

else : return 0.00
